Calling for Action on Canal Water Pollution

Historical summary for the blog preview. This is not the original progress report or an official decision.

Source and scope

HRPF Progress Report 2024 Revised. Section on contamination of canal freshwater in Mandi Bahauddin. The account describes actions and an ongoing complaint at the time of reporting; it does not verify present water quality.

The environmental concern recorded

The 2024 report attributes canal-water contamination to sewage discharge and the disposal of dead chicks by poultry farm owners. These are the reported concerns in the supplied source, rather than findings from a new water-quality test.

The account matters because it concerns the condition of a shared natural resource. An advocacy article can explain the concern and the response sought, but it should also identify the date and basis of the claim so readers do not mistake a historical report for a current environmental measurement.

Engagement with environmental authorities

HRPF's report says the Foundation raised the issue with the Secretary of Environment Punjab and the Director General of Environment. It records a direction from the Deputy Director of the I&S Department to the Assistant Director of Environment in Mandi Bahauddin to address the matter.

According to the report, senior officials were informed, show-cause notices were issued to approximately 136 poultry farm owners across the district, and some cases were referred to the Punjab Environmental Tribunal. The number and actions are attributed to the 2024 source; they are not presented as newly verified figures.

Further documentation and the Ombudsman complaint

The report also describes videos concerning sewage and city waste being discharged into the canal. It says HRPF raised the matter again with senior authorities and filed a complaint with the Provincial Ombudsman Regional Office in Mandi Bahauddin.

The source describes that complaint as being pursued with detailed documentation at the time of the report. This article preserves that historical timing. It does not claim that the case remains open today, state a final decision or infer a current enforcement outcome.

Reading the outcome with care

Notices and referrals document a response to an issue. They do not, by themselves, establish that the canal became free of pollution. The supplied account does not provide a final water-quality assessment or a record showing that all sources of contamination were removed.

Future updates should identify their own source and date. This approach allows the article to explain HRPF's advocacy while leaving room for verifiable follow-up, rather than filling gaps with assumptions.

Photographs and publication date

Photos are illustrative HRPF archive images, not verified case photographs. The website publication date is the date this summary was published, not the original incident date. Private identifiers and unverified individual allegations are omitted.
